

iLive - iDie

Smart phones are an essential part of our lives. Most of us are married to them. We use them all the time - waiting for the bus, walking down the street and even when we are dining with our friends.

AI research has created lots of different kinds of smart phone apps to help our daily lives and to entertain us. We have iTunes, iMovie, iBank, iMap, iBooks, iShop(TillIDrop) etc. The apps are just becoming smarter. Did you know that just a couple of weeks ago researchers from Boston University said they've created an artificial pancreas that syncs with an iPhone app that regulates the blood sugar?!

So I think we are not far off this app system here, which is called iLive.

These apps will take care of our basic needs - iBreathe, iMove, iSleep, iEat...then of course there'll be iPeeAndP... To help us be even more passive we will have iThink, iSpeak, iHear, iSee, iSpeak etc. Today's online dating will advance with iLove, which will find you a partner, flirt and date and get to know your lovers phone for you. Not sure how it will work, but of course there will also be iBreed. But my favourite one is iFeel. It's easy when you can just choose your feelings and mood or use the automatic mode. It is also handy that you can just uninstall it. It's especially recommended to do that when the iLive app requires you to update to the version 3.5 which is also called iDie. Just makes the use of that more comfortable.

When you sign in to the iDie, it kills you with an electric shock, calls the emergency number with all your details and where your body is, makes the arrangements for your funeral, books the priest and sends the invitation there to your family and friends.

How easy and bright does the future looks like for us!

We wonder if AI research will create computer-based robots that are smarter than people and if those robots would kill us. Instead we should think if this modern trend of mobile apps is destroying the humans by creating robots of us? Are we the ones becoming robots?
